

4. Model Selection :

The next step is to select the appropriate machine learning algorithm that is suitable for our problem. This step requires knowledge of the strengths and weakness of different algorithms. Sometimes we use multiple models and compare their results and select the best model as per our requirements.

5. Model building and Training :

After selecting the algorithm, we have to build the model.

1. In the case of traditional machine learning building mode is easy it is just a few hyperparameter tunings.
2. In the case of deep learning, we have to define layer-wise architecture along with input and output size, number of nodes in each layer, loss function, gradient descent optimizer, etc.
3. After that model is trained using the preprocessed dataset.

6. Model Evaluation

Once the model is trained, it can be evaluated on the test dataset to determine its accuracy and performance. This involves tweaking the hyperparameters of the model.

7. Deployment :

Once the model is trained and tuned, it can be deployed in a production environment to make prediction.
